

MULTI-TEMPERATURE PROFILE QUAIL EGG HATCHER

ABSTRACT

The food industry is one of the most important sectors in generating the national economy. This is because food is the basis of life that wants to maintain human survival. One of the most popular foods is quail eggs. So, the efficient production of quail eggs becomes an important process so that the output reaches the maximum level. An efficient system can also help in reducing the cost of care and manpower required.

OBJECTIVES

1. To design an automatic temperature control quail egg hatcher that can control various temperature profile.
2. To develop circuit and source code for an automatic temperature control.

PROBLEM STATEMENT

Non -automated hatching of quail eggs increase human error and causes the chances of hatching of quail eggs to be low. This is because the process of running a quail egg requires meticulous care and humans need a system that can manage and remind humans during the process of incubating quail eggs. For example, this machine can self -control the temperature and humidity for the egg hatching area. For things that require human energy such as flipping and egg observation, this machine can remind humans to do the work. The second problem is the low percentage or probability of egg hatching. This is due to inconsistent management and external problems such as power outages and machine failures. A low percentage of egg hatching can lead to wastage and the yield does not reach the maximum limit.

PRODUCT FEATURES

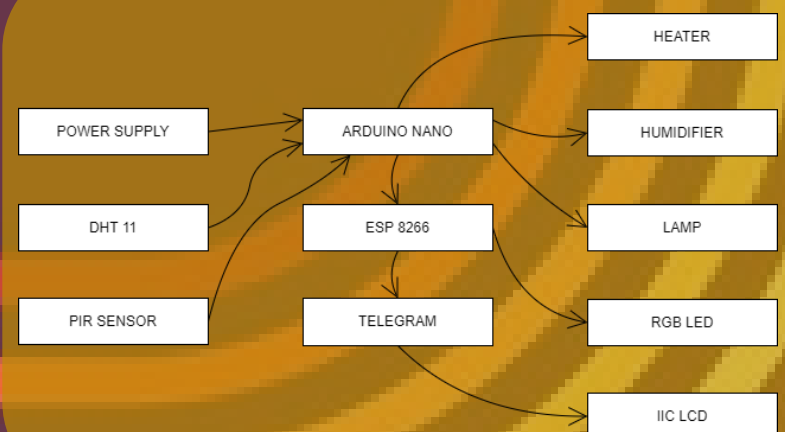

1. Monitor data from the incubator via telegram.
2. Various data options to be displayed on the LCD.
3. Auto detect movement in the hatchery.
4. *Interactive Multi-interior LED colours interchange*
5. Portable Size
6. Suitable for starter hobbyist with 12 eggs

IMPACT AND BENEFITS

1. Increase the egg hatch rate with various temperature profiles according to the day of hatching.
2. Makes it easier for hobbyists to monitor quail eggs.
